

 **Alma Hybrid™**

FAQ's:

- **What is Alma Hybrid?**
The Alma Hybrid combines both CO2 and the 1570 wavelength all in one treatment which allows for better results and less downtime. The Hybrid treats scarring, acne, rosacea, sun damage, texture, skin thickening/tightening and collagen remodeling.
- **How does it work?**
Alma Hybrid CO2 is resurfacing/ablating the skin, removing degraded tissue and forcing new healthy tissue to grow in its place, while the 1570 is leaving the surface of the skin in place and delivering microbeams deep into the dermis.
- **Who is a good candidate?**
Across the country we have seen anyone from their early 20s all the way to their 90s get the Hybrid treatment. By customizing the settings we can treat a variety of skin concerns. From a simple "glow up" all the way to someone looking for very aggressive CO2 treatment.
- **How many treatments are required?**
During your consultation your provider will assess your skin to personalize a treatment plan for you. Best results are typically seen after 3 treatments, although noticeable improvements will be seen after 1 treatment.
- **How long does each treatment take?**
For a full face resurfacing procedure we typically schedule an hour - this allows time for the application of topical anesthetic with the actual treatment taking about 15 minutes.
- **Does it hurt?**
All resurfacing treatments come with some level of discomfort. Many patients report feeling hot in the treatment area. Topical anesthetic may be used to numb the treatment area.
- **What is the downtime?**
This will vary depending on treatment plan recommended by your provider. You may experience a few days up to a few weeks of mild to moderate redness and swelling depending on treatment settings.
